(54) FOLDING-TYPE MOBILE EQUIPMENT WITH CAMERA

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a folding-type mobile equipment having a camera for ensuring excellent manipulation flexibility and visual recognition properties, which can install an image pickup camera including an imaging optical part, even if the full length of the optical system is comparatively longer, without providing a particular imaging camera setting space.

SOLUTION: In this mobile equipment 1, an upper casing 10 and a lower casing 20 are coupled to be rotatable around the axle of hinge and an imaging camera 40 is installed along the axle 5 of hinge. The imaging camera 40 is provided with an imaging window 32 for catching the incident light from an object, an deflection angle element 56 for deflecting the incident light from the imaging window 32 and an imaging optical unit 41 including lenses 46, 48 and an imaging element 54 on the imaging optical axis 3. Consequently, after the incident light from the imaging window 32 is deflected with the deflection angle element 56, it is then condensed with the lens of the imaging unit 41 and is focused on the imaging element.
